

PCOS/PMOS

Polycystic Ovarian Syndrome (PCOS)

Polyendocrine Metabolic Ovarian Syndrome (PMOS)

What is PCOS/PMOS?

This is a common condition in women that makes the ovaries to have tiny sacs filled with fluid. The ovaries can be seen with an ultrasound scan to know if a woman has PCOS/PMOS. It also causes women to produce too much male hormones (androgens). This causes an imbalance in the male and female hormones. This may lead to problems with ovulation, irregular menses, and infertility. It may also cause excess body hair, acne and/or weight gain.

How does PCOS/PMOS affect heart health?

The hormonal imbalance causes chronic inflammation and contributes to insulin resistance. This contributes to cardiovascular risk factors like pre-diabetes, type 2 diabetes, high blood pressure and bad cholesterol. These risk factors may lead to complications like atrial fibrillation, heart attack and stroke.

How do I find out if I have PCOS/PMOS?

You need to visit and discuss with your doctor to find out if you have PCOS/PMOS. The doctor will check for your hormone levels, check your ovaries with an ultrasound scan and screen you for cardiovascular risk factors.

Meanwhile, you can use the Viedial App to find out your risk factors for cardiovascular diseases.

How do you cope with PCOS/PMOS?

Even though PCOS/PMOS increases your risk for cardiovascular diseases, you can still reduce these risk factors by making changes to your lifestyle to eat healthy, get physically active, and manage stress well. Reducing alcohol intake and stopping smoking will also help to reduce cardiovascular risk factors.
